TPD	Standard Settings & Max Tank Working Pressure	94

## ADDITIONAL GROTH PRODUCTS

Please see our other Groth Datasheets for additional product lines:

# MODEL 1200A

- Sizes // 2" through 12"
- Pressure settings // 0.5 oz/in<sup>2</sup> to 15 psig
- Vacuum settings // 0.5 oz/in<sup>2</sup> to 12 psig
- Available in aluminum, carbon steel, stainless steel, fiberglass and other materials
- Modular construction

## PRESSURE/VACUUM RELIEF VALVE

Model 1200A is designed to protect your tank from damage created by overpressure or excessive vacuum. Costly product evaporation losses due to normal tank “breathing” are greatly reduced. Because the Model 1200A retains toxic vapors, atmospheric contamination is minimized. This helps to provide increased fire protection and safety.

## SPECIAL FEATURES

Model 1200A offers Groth’s special “cushioned air” seating. Superior performing fluoropolymer seating diaphragms are standard to minimize sticking caused by resinous vapors and atmospheric moisture. The Model 1200A has a self draining housing body and drip rings to protect seating surfaces from condensate and freezing. This design also avoids dangerous pressure or vacuum buildup due to binding or clogging of the valve. Buna-N, FKM and other seating diaphragms can be provided when required. To insure the proper alignment of seating surfaces, there is peripheral guiding and a center stabilizing system.

**MODEL 1200A**

**MODEL 1201B**

# SPECIFICATIONS

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% overpressure.

Read the flow capacity at 100% overpressure directly from the table above. Use linear interpolation if the set pressure is not listed.

If the allowable overpressure is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable overpressure is more than 100%, consult your Groth Representative.

Calculate the percentage overpressure by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{ OP} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% overpressure according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% overpressure at intersection of row **70** and column **5**  
"C" factor at 75% OP = **0.87**

"C" Factor Table										
%OP	0	1	2	3	4	5	6	7	8	9
10	0.42	0.43	0.44	0.45	0.46	0.46	0.47	0.48	0.49	0.50

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% over-vacuum.

Read the flow capacity at 100% over-vacuum directly from the table above. Use linear interpolation if the set vacuum is not listed.

If the allowable over-vacuum is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable over-vacuum is more than 100%, consult your Groth Representative.

Calculate the percentage over-vacuum by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{OV} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% over-vacuum according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% over-vacuum at intersection of row **70** and column **5**  
"C" factor at 75% OV = **0.87**

"C" Factor Table										
%OV	0	1	2	3	4	5	6	7	8	9

### Example—Flow Capacity Calculation

- 6" Model 1200A
- 100 mmWC Set Vacuum [P<sub>s</sub>]
- 175 mmWC Flowing Vacuum [P<sub>f</sub>]

1. Read flow capacity at set vacuum from table
2. Calculate over-vacuum
3. Read "C" factor from table
4. Calculate flow capacity

$$\text{Flow} = 2,080 \text{ NCMH}$$

$$\% \text{OV} = [(175 - 100) / 100] \times 100 = 75\%$$

$$"C" = 0.87$$

$$\text{Flow} = 0.87 \times 2,080 = 1,810 \text{ NCMH}$$

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% over-vacuum.

Read the flow capacity at 100% over-vacuum directly from the table above. Use linear interpolation if the set pressure is not listed.

If the allowable over-vacuum is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable over-vacuum is more than 100%, consult your Groth Representative.

Calculate the percentage over-vacuum by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{OV} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% over-vacuum according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 72% over-vacuum at intersection of row **40** and column **2**  
"C" factor at 42% OV = 0.55

"C" Factor Table

### Example—Flow Capacity Calculation

- 6" Model 1202B
- 0.12 barg Set Vacuum [P<sub>s</sub>]
- 0.17 barg Flowing Vacuum [P<sub>f</sub>]

1. Read flow capacity at set vacuum from table
2. Calculate over-vacuum
3. Read "C" factor from table
4. Calculate flow capacity

$$\text{Flow} = 4,530 \text{ NCMH}$$

$$\% \text{OV} = [(0.17 - 0.12) / 0.12] \times 100 = 42\%$$

$$"C" = 0.55$$

$$\text{Flow} = 0.55 \times 4,530 = 2,492 \text{ NCMH}$$

- Sizes // 2" (DN 50) through 12" (DN 300) flange sizes
- Available in aluminum, carbon steel, stainless steel
- Stable full lift at 10% overpressure
- Modulating action
- Near zero blowdown (reseats near set pressure)
- Ability to achieve set pressure/vacuum very close to tank maximum allowable working pressure/vacuum

### FULL LIFT PRESSURE/VACUUM RELIEF VALVE

The most notable advantage of the Groth Full Lift Type Valve Compared to Standard Pressure/Vacuum Relief Valves is its' ability to open at 10% overpressure while standard Pressure/Vacuum Relief Valves achieve full open capacity at 100% overpressure. The use of a Full Lift Type Valve allows the user to select the valve set pressure (vacuum) within 10% of the tank Maximum Allowable Working Pressure (vacuum). This is important because operation near the tank design pressure greatly reduces the breathing losses of the product in the tank.

### WHAT IS A FULL LIFT TYPE VALVE?

A Full Lift Type Valve is a relief valve which attains full stable lift at only 10% overpressure. Like all Groth Pressure/Vacuum Relief Valves, the Full Lift Type Valve is a modulating valve which offers near zero blowdown, meaning it reseats near set pressure. These performance capabilities are possible due to the harmonization of the nozzle, seating, and pallet areas such that the valve will achieve stable lift at only 10% above the set pressure/vacuum.

### BENEFITS

- Ability to operate process closer to Tank MAWP, increasing operating range of process
- Minimal seat leakage to prevent fugitive emission and conserve tank product
- Narrow valve operating range (from seal to full open) maximizes tank operating range and reduces total vapor emissions
- Stable lift ensures that the venting requirements of the process are reliably met
- Reduced seat leakage, low overpressure, and near zero blowdown characteristics to allow for process maintenance, minimal product loss and better tank corrosion maintenance

# SERIES 1800

## HOW TO ORDER

For easy ordering, select proper model numbers

**EXAMPLE** 1 8 0 0 A — 0 2 — 1 1 5 — T O O

Indicates a 2" Model 1800A with Aluminum Body and Seat, Stainless Steel Pallet, Fluoropolymer Seat Diaphragm, and no other options.

# MODEL 1220A

- Sizes // 2" through 12"
- Pressure settings // 0.5 oz/in<sup>2</sup> to 15 psig
- Vacuum settings // 0.5 oz/in<sup>2</sup> to 12 psig
- Available in aluminum, carbon steel, stainless steel, fiberglass and other materials
- Modular construction

## PRESSURE / VACUUM RELIEF VALVE WITH PIPE-AWAY FEATURE

Model 1220A is used for pressure and vacuum relief where vapors must be piped away. Escaping vapors are piped away through a flanged outlet connection. This helps to provide increased fire protection and safety.

## SPECIAL FEATURES

Model 1220A offers Groth's special "cushioned air" seating. Superior performing fluoropolymer seating diaphragms are standard to minimize sticking caused by resinous vapors and atmospheric moisture. The Model 1220A has a self draining housing body and drip rings to protect seating surfaces from condensate and freezing. This design also avoids pressure or vacuum buildup due to binding or clogging of the valve. Buna-N, FKM, and other seating diaphragms can be provided when required. Model 1221B may be spring loaded when required for use on blanketed tanks or other type installation requiring higher settings. To insure the proper alignment of seating surfaces there is peripheral guiding and a center stabilizing stem.

**MODEL 1220A**

**MODEL 1221B**

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% overpressure.

Read the flow capacity at 100% overpressure directly from the table above. Use linear interpolation.

If the allowable overpressure is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable overpressure is more than 100%, consult your Groth Representative.

Calculate the percentage overpressure by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{ OP} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% overpressure according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% overpressure at intersection of row 70 and column 5  
"C" factor at 75% OP = 0.87

"C" Factor Table										
%OP	0	1	2	3	4	5	6	7	8	9

### Example—Flow Capacity Calculation

- 6" Model 1220A
- 4 InWC set pressure [P<sub>s</sub>]
- 7 InWC flowing pressure [P<sub>f</sub>]

- Read flow capacity at set pressure from table
- Calculate overpressure
- Read "C" factor from table
- Calculate flow capacity

$$\text{Flow} = 112,000 \text{ SCFH}$$

$$\% \text{ OP} = [(7 - 4) / 4] \times 100 = 75\%$$

$$"C" = 0.87$$

$$\text{Flow} = 0.87 \times 112,000 = 97,440 \text{ SCFH}$$

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% overpressure.

Read the flow capacity at 100% overpressure directly from the table above. Use linear interpolation if the set pressure is not listed.

If the allowable overpressure is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable overpressure is more than 100%, consult your Groth Representative.

Calculate the percentage overpressure by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{OP} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% overpressure according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% overpressure at intersection of row 70 and column 5  
"C" factor at 75% OP = 0.87

"C" Factor Table

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% overpressure.

Read the flow capacity at 100% overpressure directly from the table above. Use linear interpolation if the set pressure is not listed.

If the allowable overpressure is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable overpressure is more than 100%, consult your Groth Representative.

Calculate the percentage overpressure by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{ OP} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% overpressure according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% overpressure at intersection of row 70 and column 5  
"C" factor at 75% OP = 0.83

"C" Factor Table

### Example—Flow Capacity Calculation

- 6" Model 1222B
- 0.12 barg Set Vacuum [P<sub>s</sub>]
- 0.17 barg Flowing Vacuum [P<sub>f</sub>]

1. Read flow capacity at set vacuum from table
2. Calculate over-vacuum
3. Read "C" factor from table
4. Calculate flow capacity

$$\text{Flow} = 4,530 \text{ NCMH}$$

$$\% \text{OV} = [(0.17 - 0.12) / 0.12] \times 100 = 42\%$$

$$"C" = 0.55$$

$$\text{Flow} = 0.55 \times 4,530 = 2,492 \text{ NCMH}$$

# MODEL 1720A/1760A

- Same size inlet and outlet connections
- “Cushioned air” seating
- Non-sticking design
- Center and peripheral pallet guiding
- Self-draining body
- Factory tested for compliance with API 2000
- ISO-Certified manufacturing facility
- Higher set pressures (in weight loaded configuration) than standard pipe-away valves

## VACUUM RELIEF VALVE WITH PIPE-AWAY FEATURE

Groth Series 1700 relief valves are designed with inlet and outlet flanges of the same size to reduce installation costs by having smaller downstream piping. Model 1720A valves are designed for systems requiring pressure and vacuum relief. Model 1760A valves are designed for systems requiring only pressure relief.

## SPECIAL FEATURES

Model 1700 offers Groth’s special “cushioned air” seating. Superior performing fluoropolymer seating diaphragms minimize sticking caused by resinous vapors and atmospheric moisture. The Model 1700 has a self draining housing body and drip rings to protect seating surfaces from condensate and freezing. This design also avoids pressure or vacuum buildup due to binding or clogging of the valve. Buna-N, FKM, and other seating diaphragms can be provided when required. Available in 2”, 3” and 4” sizes and in carbon steel, stainless steel or fiberglass. Trim materials (seat and pallet components) are 316SS. Other materials available on request. Options include stainless steel weights.

## SETTING RANGES

White bars in oz/in<sup>2</sup>. Blue bars in mbar.

	4 X 4	0.5	33	–	–	0.5	24	–	–
		2.2	142	–	–	2.2	103	–	–

The 1700 Series relief valves are also available in spring loaded designs for pressure settings up to 15 psig. Other options include FRP (Furan or Derakane) construction, positive lift indicators and special coatings. Consult the factory for details.

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% over-vacuum.

Read the flow capacity at 100% over-vacuum directly from the table above. Use linear interpolation if the set vacuum is not listed.

If the allowable over-vacuum is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable over-vacuum is more than 100%, consult your Groth Representative.

Calculate the percentage over-vacuum by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{OV} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% over-vacuum according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% over-vacuum at intersection of row 70 and column 5  
"C" factor at 75% OV = 0.87

"C" Factor Table										
%OV	0	1	2	3	4	5	6	7	8	9
10	0.42	0.43	0.44	0.45	0.46	0.46	0.47	0.48	0.49	0.50

### Example—Flow Capacity Calculation

- 6" Model 1720A
- 4 InWC Set Vacuum [P<sub>s</sub>]
- 7 InWC Flowing Vacuum [P<sub>f</sub>]

1. Read flow capacity at set vacuum from table
2. Calculate over-vacuum
3. Read "C" factor from table
4. Calculate flow capacity

$$\text{Flow} = 21,900 \text{ SCFH}$$

$$\% \text{OV} = [(7 - 4) / 4] \times 100 = 75\%$$

$$"C" = 0.87$$

$$\text{Flow} = 0.87 \times 21,900 = 19,053 \text{ SCFH}$$

## HOW TO ORDER

For easy ordering, select proper model numbers

MODEL #	SIZE	BODY MATERIAL	SEAT MATERIAL	PALLET MATERIAL	DIAPHRAGM MATERIAL	JACKET	SPECIAL OPTIONS
1720A 1760A	02 03 04	3 = Carbon Steel 5 = Stainless 6 = Vinyl Ester 7 = Furan Z = Special	5 = 316SS 6 = Vinyl Ester 7 = Furan Z = Special <small>(See note regarding seat material)</small>	5 = 316SS 6 = Vinyl Ester 7 = Furan Z = Special	B = Buna N K = FFKM T = Fluoropolymer V = FKM Z = Special	O = No Jacket N = Steam Jacket S = Vacuum Port Spacer H = Vacuum Port Spacer and Steam Jacket	O = No Options Z = Special Options

**NOTES**

- Include model number and setting when ordering.
- For steam jacket, include steam pressure/temperature.
- For special options, consult factory.
- Stainless steel seats are standard with stainless steel and carbon steel bodies.

**EXAMPLE** 1 7 2 0 A — 0 3 — 3 5 5 — B O O

Indicates a 3" x 3" Model 1720 A with CS body, 316SS seat, 316SS pallet, Buna-N diaphragm, no steam jacket and no special options.

## MODEL 12-TH

- Size: 8" (200 mm)
- Bolting: API 12
- Available Pressure Settings:  
4, 6, 8, 12, 16, 24 & 32 osig
- Available Vacuum Settings:  
0.4, 0.9 & 3.5 osig
- Leak Rate:  
1 SCFH air @ 90% of set pressure
- Materials of Construction:  
Casting: Aluminum (Non-Sparking)  
Envelope Gasket: HNBR, FKM, or Fluorosilicone  
Vacuum Diaphragm: HNBR, FKM, Fluorosilicone, or Fluoropolymer
- Optional: Polyester/PTFE Coating
- Accessories: Flange (base) Gasket, Mounting Kit

### PRESSURE/VACUUM RELIEF VALVE

The Model 12-TH Thief Hatch was designed to out perform the competition, with industry leading high flow rates and precision tolerances to provide a superior sealing performance. The leakage is less than 1 SCFH of air @ 90% of the set pressure, keeping your tanks in compliance with industry standards.

The Model 12-TH Thief Hatch incorporates a spring loaded pressure/vacuum relief valve within the device. Thief Hatches are used on steel or fiberglass (FRP) low pressure oil tanks. Providing access for level gauging, sampling, and overpressure/vacuum protection for the tanks, all in one compact design.

### SPECIAL FEATURES

- Ultra-tight sealing reduces product leakage and fugitive emissions
- Higher flow capacity to protect from excessive pressure build up
- Designed for easy maintenance, thus reducing downtime and lower operational cost
- Corrosion resistance can be enhanced with FKM soft goods and coating
- Direct replacement for any standard round API 12 thief hatch
- Incorporates a mechanical lock system to be used with a pad lock or lock out bar

# HOW TO ORDER

Maintenance Repair Kit: (use the above chart for selecting material and options)

## OPTIONAL ACCESSORIES:

Base Gasket:

- GKT12TH08K302 = Non-Asbestos
- GKT12TH087602 = FKM
- GKT12TH087102 = PTFE
- GKT12TH084402 = Black Neoprene

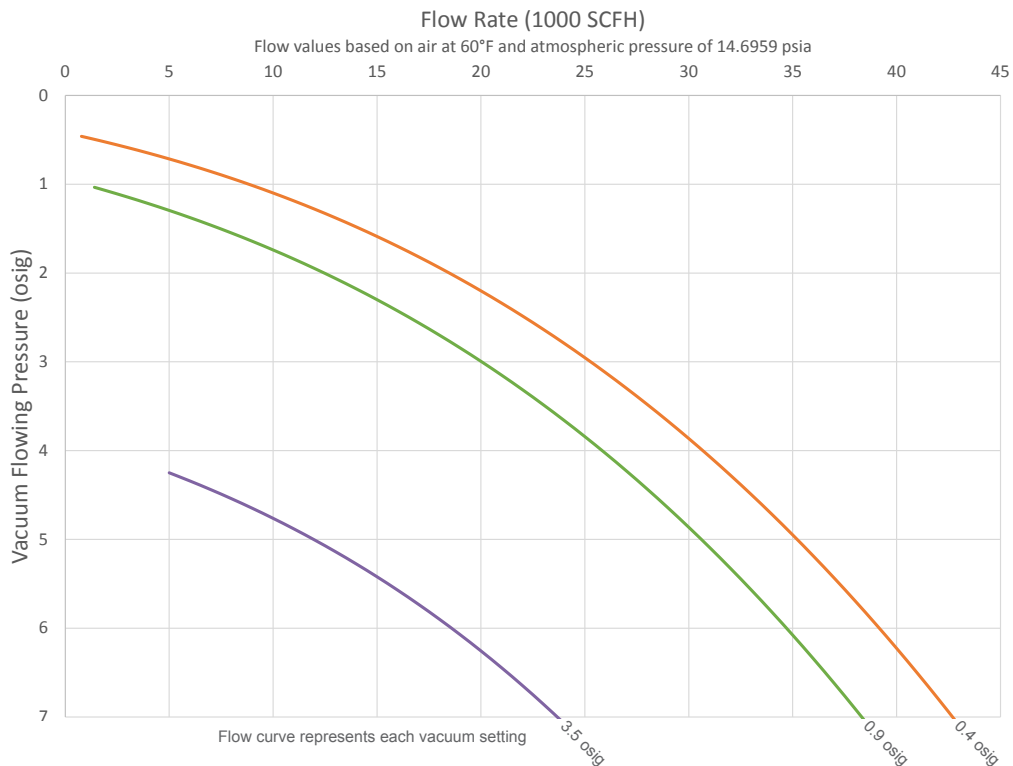

Mounting Kit:

- KS12THBS08P01 = Zinc Plated Steel (½-13 UNC Hex Nut & Bolt)

## PRESSURE RELIEF CAPACITY

## VACUUM RELIEF CAPACITY

# MODEL 1260A

- Sizes // 2" through 12"
- Pressure settings // 0.5 oz/in<sup>2</sup> to 15 psig
- Available in aluminum, carbon steel, stainless steel, fiberglass and other materials
- Modular construction

## PRESSURE RELIEF VALVE

Pressure Relief Valve Model 1260A is for use where pressure relief is required and all relieving vapors must be piped away. Tank relief, to avoid tank damage, is controlled by a spring or weight loaded pallet in the valve housing. Pressure relief valves help provide increased fire protection and safety. The Model 1260A can also be used for in-line vacuum relief where flanged inlet connection is required. Back pressure in the system must be considered when using flow curves.

## SPECIAL FEATURES

Model 1260A offers Groth's special "cushioned air" seating. Superior performing fluoropolymer seating diaphragms are standard to minimize sticking caused by resinous vapors and atmospheric moisture. The Model 1260A has a self-draining housing body and drip rings to protect seating surfaces from condensate and freezing. This design also avoids pressure or vacuum buildup due to binding or clogging of the valve. Buna-N, FKM and other seating diaphragms can be provided when required.

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% overpressure.

Read the flow capacity at 100% overpressure directly from the table above. Use linear interpolation.

If the allowable overpressure is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable overpressure is more than 100%, consult your Groth Representative.

Calculate the percentage overpressure by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{ OP} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% overpressure according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% overpressure at intersection of row 70 and column 5  
"C" factor at 75% OP = 0.87

"C" Factor Table

### Example—Flow Capacity Calculation

- 6" Model 1260A
- 100 mmWC Set Pressure [P<sub>s</sub>]
- 175 mmWC Flowing Pressure [P<sub>f</sub>]

1. Read flow capacity at set pressure from table
2. Calculate overpressure
3. Read "C" factor from table
4. Calculate flow capacity

Flow = 3,140 NCMH  
 $\% \text{OP} = [(175 - 100) / 100] \times 100 = 75\%$   
 "C" = 0.87  
**Flow = 0.87 x 3,140 = 2,732 NCMH**

# MODEL 1261A // PRESSURE RELIEF CAPACITY

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% overpressure.

Read the flow capacity at 100% overpressure directly from the table above. Use linear interpolation if the set pressure is not listed.

If the allowable overpressure is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable overpressure is more than 100%, consult your Groth Representative.

Calculate the percentage overpressure by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{ OP} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% overpressure according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% overpressure at intersection of row 70 and column 5  
"C" factor at 75% OP = 0.83

"C" Factor Table

### Example—Flow Capacity Calculation

- 6" Model 1261A
- 0.4 barg Set Pressure [P<sub>s</sub>]
- 0.7 barg Flowing Pressure [P<sub>f</sub>]

1. Read flow capacity at set pressure from table
2. Calculate overpressure
3. Read "C" factor from table
4. Calculate flow capacity

Flow = 16,200 NCMH  
 % OP = [(0.7 - 0.4)/0.4] x 100 = 75%  
 "C" = 0.83  
**Flow = 0.83 x 16,200 = 13,446 NCMH**

# MODEL 2300A

- Sizes // 2" through 12"
- Pressure settings // 0.5 oz/in<sup>2</sup> to 15 psig
- Available in aluminum, carbon steel, stainless steel, and other materials

## EMERGENCY RELIEF VALVE

Model 2300A is designed for emergency relief capacity above that supplied by a standard operating valve used on tanks, piping, and low pressure vessels. Emergency relief valves provide relief from excessive internal pressures which may cause tank damage.

## SPECIAL FEATURES

Model 2300A is built of corrosion resistant material throughout. Groth's self-closing special fluoropolymer "cushioned air" pallet with center stabilizing stem and peripheral guiding provides uniform seating and alignment. Superior performing fluoropolymer seating diaphragms are standard to minimize sticking caused by resinous vapors and atmospheric moisture. The guides support a spun weatherhood which covers and protects the entire valve structure. As added protection against the entry of foreign matter, a mesh screen encircles the valve under the weatherhood. Buna-N, FKM and other seating diaphragms can be provided when required.

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% overpressure.

Read the flow capacity at 100% overpressure directly from the table above. Use linear interpolation.

If the allowable overpressure is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable overpressure is more than 100%, consult your Groth Representative.

Calculate the percentage overpressure by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{ OP} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% overpressure according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% overpressure at intersection of row 70 and column 5  
"C" factor at 75% OP = 0.87

"C" Factor Table

### Example—Flow Capacity Calculation

- 6" Model 2300A
- 100 mmWC Set Pressure [P<sub>s</sub>]
- 175 mmWC Flowing Pressure [P<sub>f</sub>]

1. Read flow capacity at set pressure from table
2. Calculate overpressure
3. Read "C" factor from table
4. Calculate flow capacity

Flow = 3,490 NCMH  
 $\% \text{ OP} = [(175 - 100) / 100] \times 100 = 75\%$   
 "C" = 0.87  
**Flow = 0.87 x 3,490 = 3,036 NCMH**

# MODEL 2301A // PRESSURE RELIEF CAPACITY

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% overpressure.

Read the flow capacity at 100% overpressure directly from the table above. Use linear interpolation if the set pressure is not listed.

If the allowable overpressure is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable overpressure is more than 100%, consult your Groth Representative.

Calculate the percentage overpressure by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{ OP} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% overpressure according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% overpressure at intersection of row 70 and column 5  
"C" factor at 75% OP = 0.83

"C" Factor Table

### Example—Flow Capacity Calculation

- 6" Model 2301A
- 0.4 barg Set Pressure [P<sub>s</sub>]
- 0.7 barg Flowing Pressure [P<sub>f</sub>]

1. Read flow capacity at set pressure from table
2. Calculate overpressure
3. Read "C" factor from table
4. Calculate flow capacity

Flow = 17,100 NCMH  
 % OP = [(0.7 - 0.4)/0.4] x 100 = 75%  
 "C" = 0.83  
**Flow = 0.83 x 17,100 = 14,193 NCMH**

# MODEL 1300

- Sizes // 2" through 12"
- Vacuum settings // 0.5 oz/in<sup>2</sup> to 12 psig
- Available in aluminum, carbon steel, stainless steel, and other materials
- Modular construction

## VACUUM RELIEF VALVE

Model 1300A is used when vacuum relief is the only requirement. Intake relief necessary under working conditions is achieved by a spring or weight loaded pallet. This feature of the Model 1300A reduces the possibility of tank damage. The Model 1300A helps to provide increased fire protection and safety. Valve size must be selected to perform required vacuum relief under operating and thermal conditions. Flow curves for vacuum relief are provided.

## SPECIAL FEATURES

Model 1300A offers Groth's special "cushioned air" seating. Superior performing fluoropolymer seating diaphragms are standard to minimize sticking caused by resinous vapors and atmospheric moisture. The Model 1300A has a self draining housing body and drip rings to protect seating surfaces from condensate and freezing. This design also avoids vacuum buildup due to binding or clogging of the vent. Metal-to-metal, Buna-N, FKM and other seating diaphragms can be provided when required.

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% over-vacuum.

Read the flow capacity at 100% over-vacuum directly from the table above. Use linear interpolation if the set vacuum is not listed.

If the allowable over-vacuum is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable over-vacuum is more than 100%, consult your Groth Representative.

Calculate the percentage over-vacuum by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{OV} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% over-vacuum according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% Over-vacuum at intersection of row **70** and column **5**  
"C" factor at 75% OV = **0.87**

"C" Factor Table

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% over-vacuum.

Read the flow capacity at 100% over-vacuum directly from the table above. Use linear interpolation if the set vacuum is not listed.

If the allowable over-vacuum is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable over-vacuum is more than 100%, consult your Groth Representative.

Calculate the percentage over-vacuum by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{OV} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% over-vacuum according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% over-vacuum at intersection of row **70** and column **5**  
"C" factor at 75% OV = **0.87**

"C" Factor Table										
%OV	0	1	2	3	4	5	6	7	8	9

### Example—Flow Capacity Calculation

- 6" Model 1300A
- 100 mmWC Set Vacuum [P<sub>s</sub>]
- 175 mmWC Flowing Vacuum [P<sub>f</sub>]

1. Read flow capacity at set vacuum from table
2. Calculate over-vacuum
3. Read "C" factor from table
4. Calculate flow capacity

$$\text{Flow} = 2,080 \text{ NCMH}$$

$$\% \text{OV} = [(175 - 100) / 100] \times 100 = 75\%$$

$$"C" = 0.87$$

$$\text{Flow} = 0.87 \times 2,080 = 1,810 \text{ NCMH}$$

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% over-vacuum.

Read the flow capacity at 100% over-vacuum directly from the table above. Use linear interpolation if the set pressure is not listed.

If the allowable over-vacuum is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable over-vacuum is more than 100%, consult your Groth Representative.

Calculate the percentage over-vacuum by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{OV} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% over-vacuum according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 72% over-vacuum at intersection of row **40** and column **2**  
"C" factor at 42% OV = 0.55

"C" Factor Table

### Example—Flow Capacity Calculation

- 6" Model 1301A
- 0.12 barg Set Vacuum [P<sub>s</sub>]
- 0.17 barg Flowing Vacuum [P<sub>f</sub>]

1. Read flow capacity at set vacuum from table
2. Calculate over-vacuum
3. Read "C" factor from table
4. Calculate flow capacity

Flow = 4,530 NCMH

$$\% \text{OV} = [(0.17 - 0.12) / 0.12] \times 100 = 42\%$$

"C" = 0.55

$$\text{Flow} = 0.55 \times 4,530 = 2,492 \text{ NCMH}$$

# MODEL 1360A

- Sizes // 3" through 14"
- Vacuum settings // 0.5 oz/in<sup>2</sup> to 12 psig
- Available in aluminum, carbon steel, stainless steel, fiberglass and other materials

## VACUUM RELIEF VALVE

Model 1360A is used when vacuum relief is the only requirement. The Model 1360A may be side mounted on the tank body or piped in. Intake relief necessary under working conditions is achieved by a spring or weight loaded pallet in the valve housing. The Model 1360A reduces the possibility of tank damage.

Valve size must be selected to meet required vacuum relief under operating and thermal conditions. Flow curves for vacuum relief are provided.

## SPECIAL FEATURES

Model 1300A offers Groth's special "cushioned Model 1360A offers Groth's special "cushioned air" seating. Superior performing fluoropolymer seating diaphragms are standard to minimize sticking caused by resinous vapors and atmospheric moisture. The Model 1360A has a self draining housing body and drip rings to protect seating surfaces from condensate and freezing. This design also avoids vacuum buildup due to binding or clogging of the vent. Metal-to-metal, Buna-N, FKM and other seating diaphragms can be provided when required.

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% over-vacuum.

Read the flow capacity at 100% over-vacuum directly from the table above. Use linear interpolation if the set vacuum is not listed.

If the allowable over-vacuum is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable over-vacuum is more than 100%, consult your Groth Representative.

Calculate the percentage over-vacuum by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{ OV} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% over-vacuum according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% Over-vacuum at intersection of row **70** and column **5**  
"C" factor at 75% OV = **0.87**

"C" Factor Table										
%OV	0	1	2	3	4	5	6	7	8	9

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% over-vacuum.

Read the flow capacity at 100% over-vacuum directly from the table above. Use linear interpolation if the set vacuum is not listed.

If the allowable over-vacuum is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable over-vacuum is more than 100%, consult your Groth Representative.

Calculate the percentage over-vacuum by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{ OV} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% over-vacuum according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% over-vacuum at intersection of row **70** and column **5**  
"C" factor at 75% OV = **0.87**

### Example—Flow Capacity Calculation

- 6" Model 1361A
- 2 psig Set Vacuum [P<sub>s</sub>]
- 3.5 psig Flowing Vacuum [P<sub>f</sub>]

1. Read flow capacity at set vacuum from table
2. Calculate over-vacuum
3. Read "C" factor from table
4. Calculate flow capacity

$$\text{Flow} = 116,000 \text{ SCFH}$$

$$\% \text{ OV} = [(3.50 - 2.0) / 2.0] \times 100 = 75\%$$

$$"C" = 0.83$$

$$\text{Flow} = 0.83 \times 116,000 = 96,280 \text{ SCFH}$$

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% over-vacuum.

Read the flow capacity at 100% over-vacuum directly from the table above. Use linear interpolation if the set pressure is not listed.

If the allowable over-vacuum is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable over-vacuum is more than 100%, consult your Groth Representative.

Calculate the percentage over-vacuum by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{OV} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% over-vacuum according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 72% over-vacuum at intersection of row 40 and column 2  
"C" factor at 42% OV = 0.55

"C" Factor Table

### Example—Flow Capacity Calculation

- 6" Model 1361A
- 0.12 barg Set Vacuum [P<sub>s</sub>]
- 0.17 barg Flowing Vacuum [P<sub>f</sub>]

1. Read flow capacity at set vacuum from table
2. Calculate over-vacuum
3. Read "C" factor from table
4. Calculate flow capacity

Flow = 3,200 NCMH  
 $\% \text{OV} = [(0.17 - 0.12) / 0.12] \times 100 = 42\%$   
 "C" = 0.55  
**Flow = 0.55 x 3,200 = 1,760 NCMH**

# MODEL 5000

- Sizes // 2" through 12"
- Available in carbon steel, stainless steel, and other materials
- High flow capacity

**MODEL 5100**

## FREE VENTS

Model 5100 Series are designed to be used on tanks containing non-volatile liquids and on vent pipe extremities. Groth Free Vents offer efficient flow capacity for the protection of the tank.

## SPECIAL FEATURES

Model 5100 Series are built of corrosion resistant materials throughout. A wire mesh screen prevents foreign matter from entering the tank or pipe opening. Weather hoods are easily removable for inspection of vent and wire mesh screen.

# MODEL 6000

- Sizes // 4" through 10"
- Available in aluminum, carbon steel, stainless steel, and other materials
- Available in free lift or lockdown cover
- Designed to assure uniform seating

## GAUGE HATCH

Model 6000 Series provide access for gauging or obtaining product samples from storage tanks. The Model 6000 also provides pressure relief as emergency venting. The Model 6100 incorporates a positive cover hold down which assures a premium tight seal on tanks with internal pressures up to 3 psig. Gasketed covers are recommended on tanks with high pressure settings. Model 6100 offers lockdown capability.

## SPECIAL FEATURES

Model 6000 Series is designed with a serrated foot lever surface to avoid foot slippage when opening. This model permits the use of both hands during gauging or sampling. Gravity will close the cover upon removal of pressure on the foot treadle. Groth's special "cushioned-air" seating or metal-to-metal seatings available.

**MODEL 6000**

**MODEL 6100**

# SPECIFICATIONS

Specifications subject to change without notice. Certified dimensions available upon request.

Size (Metric)	A Width (Metric)	B Height (Metric)	Approx. Ship Wt. Lbs. Aluminum
4" (100 mm)	10" (250 mm)	6" (152 mm)	7 (3 kg)
6" (150 mm)	12.50" (318 mm)	8" (203 mm)	10 (5 kg)
8" (200 mm)	15" (381 mm)	8" (203 mm)	13 (6 kg)
10" (250 mm)	17.75" (451 mm)	9" (229 mm)	17 (8 kg)

‡ When gauge hatch includes the lockdown feature, change model number to 6100.

† 150 # ANSI. drilling compatibility, F.F. on aluminum, carbon steel, and stainless steel alloys.

## HOW TO ORDER

For easy ordering, select proper model numbers

### NOTES

- Include model number and setting when ordering.
- For special options, consult factory.

**EXAMPLE**    6 0 0 0 — 0 4 — 1 — T D O

Indicates a 4" Model 6000 with Aluminum Body, Fluoropolymer Seat Diaphragm, Drilled Flange and no other options.

# MODEL 2000A

- Sizes // 16", 20" and 24"
- Pressure settings // 1.5 - 16 oz/in<sup>2</sup>
- Vacuum settings // 0.5 - 4 oz/in<sup>2</sup>
- Available in carbon steel, stainless steel, fiberglass and other materials
- Easy access manway combined with emergency relief

## EMERGENCY PRESSURE RELIEF VALVE

Model 2000A is designed to provide emergency relief capacity beyond that furnished by the normal operating pressure relief valve on the tank. The valve protects the tank against rupture or explosion that could result from excessive internal pressures caused by fire, etc. As excessive pressure builds up, the Groth Model 2000A relieves excess pressure, then reseats when pressure has been dissipated. Removable stops can be provided which restrict the lift of the cover.

## SPECIAL FEATURES

Model 2000A is built of corrosion resistant materials throughout. A grounding cable connects the head and flange. Groth's special fluoropolymer "cushioned air" pallet and peripheral guiding insures proper alignment and integrity of seating. Model 2050A incorporates a vacuum breaker for added vacuum relief capability.

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% overpressure.

Read the flow capacity at 100% overpressure directly from the table above. Use linear interpolation if the set pressure is not listed.

If the allowable overpressure is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable overpressure is more than 100%, consult your Groth Representative.

Calculate the percentage overpressure by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{ OP} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% overpressure according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% overpressure at intersection of row 70 and column 5  
"C" factor at 75% OP = 0.95

"C4" Factor Table - Pressure Only										
%OP	0	1	2	3	4	5	6	7	8	9

\* Standard vacuum settings, consult factory for other settings.

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% overpressure.

Read the flow capacity at 100% overpressure directly from the table above. Use linear interpolation if the set pressure is not listed.

If the allowable overpressure is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable overpressure is more than 100%, consult your Groth Representative.

Calculate the percentage overpressure by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{ OP} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% overpressure according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% overpressure at intersection of row 70 and column 5  
"C" factor at 75% OP = 0.95

"C4" Factor Table - Pressure Only										
%OP	0	1	2	3	4	5	6	7	8	9
10	0.70	0.71	0.71	0.72	0.72	0.73	0.73	0.74	0.74	0.75
20	0.75	0.76	0.76	0.77	0.77	0.78	0.78	0.79	0.79	0.80
30	0.80	0.81	0.81	0.82	0.82	0.83	0.83	0.84	0.84	0.85
40	0.85	0.86	0.86	0.87	0.87	0.88	0.88	0.89	0.89	0.90
50	0.90	0.90	0.90	0.91	0.91	0.91	0.91	0.91	0.92	0.92

90	0.98	0.98	0.98	0.99	0.99	0.99	0.99	0.99	1.00	1.00

### Example—Flow Capacity Calculation

20" Model 2000A  
100 mmWC Set Pressure [P<sub>s</sub>]  
175 mmWC Flowing Pressure [P<sub>f</sub>]

1. Read flow capacity at set pressure from table
2. Calculate overpressure
3. Read "C" factor from table
4. Calculate flow capacity

Flow = 23,300 NCMH  
% OP = [(175 - 100)/100] x 100 = 75%  
"C" = 0.95  
**Flow = 0.95 x 23,300 = 22,135 NCMH**

# MODEL 2100

- Sizes // 16", 20" and 24"
- Pressure settings // 1 - 15 psig
- Available in carbon steel, stainless steel and other materials
- Unique design // spring loaded cover

## EMERGENCY PRESSURE RELIEF VALVE

Model 2100 is designed to provide emergency relief capacity beyond that furnished by the normal operating pressure relief valve on the tank. The valve protects the tank against rupture or explosion that could result from excessive internal pressures caused by fire, etc. As excessive pressure builds up, Model 2100 relieves, then reseats when the overpressure has been dissipated.

## SPECIAL FEATURES

Model 2100 is built of corrosion resistant materials throughout. It is designed with independently adjustable springs which load the cover and keep the valve tightly sealed until set pressure is reached. The Model 2100 features a FKM seating to ensure a tight seal.

### Example—Flow Capacity Calculation

- 20" Model 2100
- 0.4 barg Set Pressure [P<sub>s</sub>]
- 0.7 barg Flowing Pressure [P<sub>f</sub>]

1. Read flow capacity at set pressure from table
2. Calculate overpressure
3. Read "C" factor from table
4. Calculate flow capacity

$$\text{Flow} = 64,900 \text{ NCMH}$$

$$\% \text{ OP} = [(0.7 - 0.4) / 0.4] \times 100 = 75\%$$

$$"C" = 0.83$$

$$\text{Flow} = 0.83 \times 64,900 = 53,867 \text{ NCMH}$$

# MODEL 2400A//2450A

- Sizes // 16", 20" and 24"
- Pressure settings // 1.5 - 8 oz/in<sup>2</sup>
- Vacuum settings // 0.5 - 4 oz/in<sup>2</sup>
- Hinged with lift stop for positive reseating
- Available in carbon steel, stainless steel, and other materials
- Easy access manway combined with emergency relief

## EMERGENCY PRESSURE RELIEF VALVE

Series 2400A is designed to provide emergency relief capacity beyond that furnished by the normal operating pressure/vacuum relief valve on the tank. The valve protects the tank against rupture or internal pressures caused by fire exposure. Series 2400A is designed to be self-closing. As excessive pressure builds up, Series 2400A relieves, then reseats when overpressure has been dissipated. Counter weights are available for lower settings.

## SPECIAL FEATURES

Model 2000A is built of corrosion resistant materials throughout. Groth's special fluoropolymer "cushioned air" pallet and peripheral guiding insures proper alignment and integrity of seating. Model 2450A incorporates a vacuum breaker for added vacuum relief capability.

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% overpressure.

Read the flow capacity at 100% overpressure directly from the table above. Use linear interpolation if the set pressure is not listed.

If the allowable overpressure is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable overpressure is more than 100%, consult your Groth Representative.

Calculate the percentage overpressure by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{ OP} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% overpressure according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% overpressure at intersection of row 70 and column 5  
"C" factor at 75% OP = 0.95

"C4" Factor Table - Pressure Only

### Example—Flow Capacity Calculation

- 20" Model 2400A
- 4 InWC set pressure [P<sub>s</sub>]
- 7 InWC flowing pressure [P<sub>f</sub>]

- Read flow capacity at set pressure from table
- Calculate overpressure
- Read "C" factor from table
- Calculate flow capacity

Flow = 829,000 SCFH

% OP = [(7 - 4)/4] x 100 = 75%

"C" = 0.95

Flow = 0.95 x 829,000 = 787,550 SCFH

# 2400A/2450A // PRESSURE/ VACUUM RELIEF CAPACITY

Air Flow Capacity at 100% Overpressure (Double Set Pressure/Vacuum)						
1000 Normal Cubic Meters per Hour at 0° C

350	34.3	27.5	43.5	63.2		

\* Standard vacuum settings, consult factory for other settings.

## FLOW CAPACITY CALCULATION

Flow capacity values listed above are based on full open valves at 100% overpressure.

Read the flow capacity at 100% overpressure directly from the table above. Use linear interpolation if the set pressure is not listed.

If the allowable overpressure is less than 100%, modify the flow capacity using the appropriate "C" factor from the table. If allowable overpressure is more than 100%, consult your Groth Representative.

Calculate the percentage overpressure by the following formula. Note that all pressures are gauge pressure expressed in the same units of measure.

$$P_f = \text{Flowing pressure}$$

$$P_s = \text{Set pressure}$$

$$\% \text{ OP} = [(P_f - P_s) / P_s] \times 100$$

Calculate flow capacity at less than 100% overpressure according to the following example.

### Example—To find "C" factor from table:

Read "C" factor for 75% overpressure at intersection of row 70 and column 5  
"C" factor at 75% OP = 0.95

"C4" Factor Table - Pressure Only										
%OP	0	1	2	3	4	5	6	7	8	9
10	0.70	0.71	0.71	0.72	0.72	0.73	0.73	0.74	0.74	0.75
20	0.75	0.76	0.76	0.77	0.77	0.78	0.78	0.79	0.79	0.80
30	0.80	0.81	0.81	0.82	0.82	0.83	0.83	0.84	0.84	0.85
40	0.85	0.86	0.86	0.87	0.87	0.88	0.88	0.89	0.89	0.90
50	0.90	0.90	0.90	0.91	0.91	0.91	0.91	0.91	0.92	0.92
60	0.92	0.92	0.92	0.93	0.93	0.93	0.93	0.93	0.94	0.94
70	0.94	0.94	0.94	0.95	0.95	0.95	0.95	0.95	0.96	0.96
80	0.96	0.96	0.96	0.97	0.97	0.97	0.97	0.97	0.98	0.98
90	0.98	0.98	0.98	0.99	0.99	0.99	0.99	0.99	1.00	1.00

### Example—Flow Capacity Calculation

20" Model 2400A  
100 mmWC Set Pressure [P<sub>s</sub>]  
175 mmWC Flowing Pressure [P<sub>f</sub>]

1. Read flow capacity at set pressure from table
2. Calculate overpressure
3. Read "C" factor from table
4. Calculate flow capacity

Flow = 23,300 NCMH  
% OP = [(175 - 100)/100] x 100 = 75%  
"C" = 0.95  
**Flow = 0.95 x 23,300 = 22,135 NCMH**

# FIBERGLASS RELIEF VALVES

- Groth provides fiberglass products for corrosive service
- Available Available in Series 1200A, 1300A, 2000A and others

## FIBERGLASS SERIES 1200A, 1300A, 2000A AND OTHERS

Fiberglass valves are used the same as their counterparts manufactured in metal, primarily on aboveground storage tank installations. Fiberglass construction can be used where highly corrosive and toxic liquids are being stored. The fiberglass series design will protect the tank from damage created by overpressuring or excessive vacuum. Costly product evaporation losses due to normal tank “breathing” are greatly reduced. Retention of product vapors reduces the possibility of atmospheric contamination.

## SPECIAL FEATURES

Fiberglass valves offer Groth’s special “cushioned air” seating. Superior performing fluoropolymer seating diaphragms are standard to minimize sticking caused by resinous vapors and atmospheric moisture. These valves have a self draining housing body and drip rings to protect seating surfaces from condensate and freezing. This design also avoids pressure or vacuum buildup due to binding or clogging of the valves. These fiberglass valves may be spring loaded when required for use on blanketed tank or other type installations requiring higher settings. To insure the proper alignment of seating surfaces there is peripheral guiding and a center stabilizing stem.

- Dimensional drawings on request.
- Chemical resistance information provided by Dow Chemical (Vinyl Ester Resin) and Qua Corr (Furan).
- End user to make final determination on suitability of chemical resistance
- Consult a chemical resistance guide or handbook for additional material compatibility information.
- For Flow Data see corresponding model literature.

# STEAM JACKETED VALVES

- Prevents freezing and product buildup
- Designed for easy maintenance
- Available in Series 1200A, 1300A, 2000A and others

## STEAM JACKETED VALVES

Steam jacketed valves are designed for use on tanks containing liquids whose vapors may crystallize at normal temperature. They afford protection against valve clogging. Uniform heating of the housing and valves assures the valve will remain in operating condition. Available on model numbers 1200A, 1220A, 1260A, 1300A, 1360A, 2000A, 2300A and 2400A.

## SPECIAL FEATURES

Valve covers can be easily removed for convenient inspection and maintenance. Steam heated valves are suitable for steam circulation up to 100 psig saturated.

## STANDARD SETTINGS AND MAXIMUM TANK WORKING PRESSURE

### 1200A Series Valves

Due to the modular construction of Groth pressure/vacuum relief valves, internal components can be utilized which permit settings as low as 0.5 oz/in<sup>2</sup> and as high as 15 psig. Similarly, vacuum relief valves may withstand tank working pressures as high as 100 psig (special construction required).

However, the light weight formed pallets required for low vacuum settings may not withstand the high working pressures, and the heavier machined plate pallets required for high working pressures may not permit low vacuum settings.

The following table defines the minimum vacuum setting as a function of the maximum tank working pressures for Models 1201B, 1221B, 1300A and 1360A valves based on the dead weight of each pallet assembly.

Minimum Vacuum Settings versus Maximum Tank Working Pressure						
Size (inches)	Spun Pallet		Stamped Pallet		Machined Pallet	
	Minimum* Vacuum Setting [oz/in <sup>2</sup> ]	Maximum Tank Pressure [psig]	Minimum Vacuum Setting [oz/in <sup>2</sup> ]	Maximum Tank Pressure [psig]	Minimum Vacuum Setting [oz/in <sup>2</sup> ]	Maximum Tank Pressure [psig] <sup>o</sup>
2"	0.50	15	1.2	25	1.9	30
3"	0.50	15	1.2	25	1.8	30
4"	0.50	12	1.0	20	1.5	30
6"	0.50	12	1.3	20	2.4	30
8"	0.50	5	1.3	15	2.2	30
10"	0.50	5	1.2	15	3.2	30
12"	0.50	5	1.1	15	3.1	30

\*Some sizes require non-ferrous components to achieve 0.5 oz/in<sup>2</sup> setting. <sup>o</sup>Consult factory for MAWP >30 psig.
